

Assignment 1

Animal Conservation

Perfect Marenga
MSc. Computational Mechanics

Millions of years ago a lot of dinosaur species went extinct due to the natural causes of the time and what's left for us is an imagination of what kind of a world that was. Today this world contains several species which have endured and evolved throughout the ages beating all the climatic and ecological changes that saw some other animals' species to their extinction, one such specie is the black rhinoceros, yet with all their wit and a historical record of surviving even in the toughest of times, today they are on the brink of extinction not because of environmental or climatic changes but due to human effort, also the Iberian Lynx mostly found in Europe is also on the brink of extinction.

Through the ages human beings have established themselves at the top of the food chain, and that came at a cost with regard to other species in general. At the present moment several species have been condemned to extinction due to human activities for example, the western black rhinoceros (was found mostly in the western part of Africa), and many others.

Therefore, there is a greater need for global conservation awareness and global citizens involvement in order to purge and control some of these activities and allow the generations to come a chance to take pleasure in associating and learning about our world through physical interaction with these species than a condemnation to imagination.

In as much as several conservation groups have already started campaigns in this regard, there is need for individual effort, more people getting involved and participating to this end. Finally, for the sake of generation to come and for the animals themselves, let us join hands and work together against such activities, and let us not undermine our individual involvements or see them as insignificant, for those small contributions can go a long way in addressing this problem.
